int age = 10;

~~Int 4~~

$n = 1 \rightarrow 2 \rightarrow 18$   
 $n = 2 \rightarrow 1$

$\text{int } n = (\text{condition}) ? \text{val} : \text{val2}$

## # Switch Case

$\Rightarrow$  ist  $\odot$   $\rightarrow$  input

$n=1 \rightarrow \text{succ} (n \text{ mod})$

2)  $n \times 2$  in  $(-T_{\text{max}})$

$$x = \xi(\alpha \delta^2)$$

no s (2nd)

## # Switch

Switch (variable) {

case C1:  
    {  
        break

case C2:  
    {  
        break

}

① writing default is optional

## # Array List

int arr[] = new int[10];

→ Problem with arrays is they  
are fixed in size.

②

→ This problem is solved by a data structure called Array List.

[dynamic sized  
arrays.]

⇒ How to use Array List in code

ArrayList<Integer> arr = new ArrayList<>();  
/ float >

11.11.11

< float >  
< Characters >  
< String >  
< Double >

⇒ Operations on ArrayList

- 1) .add(x)
- 2) .get(index);

Q) Create an array list of String.

Add 4 names to it.

print the size

remove one name at index

print all.

clear the array list.

1 2 3 6 9  
7 8 4 5

1 2 3

{ for (i = 0; i < n; i++)

for (i = 0; i < n; i++)  
 if (arr[i] < min) min = arr[i];  
 return min;
